

Exporting and Importing a Style in Inventor R9

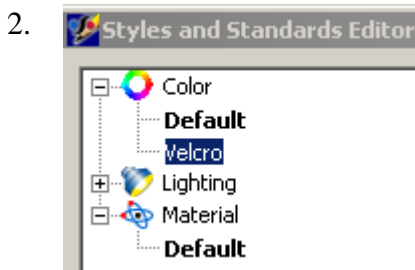

I needed to define a Velcro strip for an assembly I was working on. So I created the desired shape and then defined a color I named **Velcro**.

Next, I wanted to make that custom color available in another assembly.

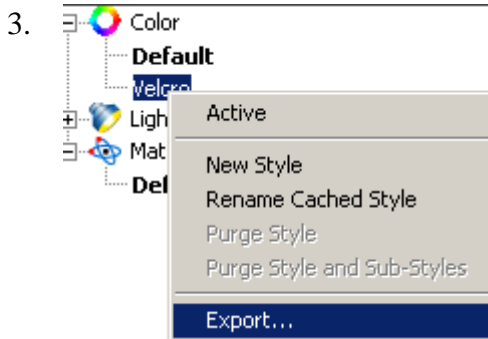

Go to **Format**→**Styles Editor**.

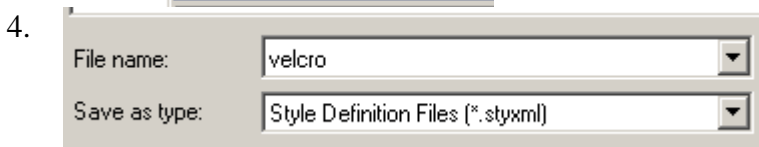

Expand the Color section.

Locate the custom color – Velcro.

Highlight the custom color.
Right click and select **Export**.

Browse to the folder where you want to store your styles.

5. Name your style **Velcro**.
Press **Save**.

6. Press **Done** to close the dialog.
7. Window over or open the assembly/part file where you want to import your style.

8.  Go to **Format→Styles Editor**.

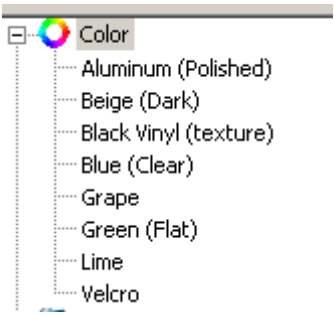

9.  Go to **Import**.

10.  Select the style file you defined earlier.
Press **Open**.

11.  The color is now available in your active file.
